

Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

1. (Currently Amended) User interface for providing operational input to a portable telecommunication device without using keys, the user interface comprising:
an electromechanical actuator including an electrical drive means provided with supply means for electrical power and a movable means arranged in relation to the electrical drive means in such a way that the movable means performs a mechanical movement when electrical power is supplied to the electrical drive means, and wherein an electric signal is induced in the electrical drive means when the portable telecommunication device is moved in a way that causes the movable means to move, and
a sensing unit for sensing the induced electrical signal, wherein the user interface further comprises:
a control means for controlling a desired operation of portable telecommunication device by means of the signal induced in the electrical drive means, wherein the control means include means for stopping the movable means in a position that makes it possible for it to move when the portable telecommunication device is moved.
2. (Previously Presented) User interface as defined in claim 1, wherein the control means includes means for providing a control signal used for switching a function on/off.
3. (Previously Presented) User interface as defined in claim 1, wherein the control means includes means for providing a control signal used for switching the telecommunication device to a specific mode.
4. (Cancelled)
5. (Previously Presented) User interface as defined in claim 1, wherein the control means includes means for stopping the movement of the movable means before the portable telecommunication device is switched to a induced electrical signal operation mode.

6. (Previously Presented) User interface as defined in claim 1, wherein the control means includes means for providing an identification signal for informing the user that the portable telecommunication device is switched to a induced electrical signal operation mode.
7. (Previously Presented) User interface as defined in claim 1, wherein the sensing unit includes means for providing an identification signal identifying the direction of movement of the movable means.
8. (Previously Presented) User interface as defined in claim 1, wherein the electromechanical actuator is a rotating electric motor provided with rotating eccentric means.
9. (Previously Presented) User interface as defined in claim 1, wherein the electromechanical actuator is a linear electric actuator provided with coil means and a moving magnetic core.
10. (Currently Amended) User interface as defined in claim 1, wherein the sensing unit comprises an amplifier and a ~~threshold~~threshold unit whereby a control signal is generated in the control unit when the voltage exceeds a predefined threshold voltage.
11. (Currently Amended) Use of an electromechanical actuator including an electrical drive means provided with supply means for electrical power and a movable means arranged in relation to the electrical drive means in such a way that the movable means performs a mechanical movement when electrical power is supplied to the electrical drive means, control means including means for stopping the movable means in such a position that makes it possible for the movable means to move when the portable telecommunication device is moved, and wherein an electric signal is induced in the electrical drive means when the portable telecommunication device is moved in a way that causes the movable means to move, as a user interface for providing operational input to ~~[[a]]the~~ portable telecommunication device without using keys for providing operational input in ~~[[a]]the~~ portable telecommunication device.

12. (Currently Amended) A portable telecommunication device comprising:
a user interface for providing operational input to a portable telecommunication device without using keys, the user interface comprising an electromechanical actuator including an electrical drive means provided with supply means for electrical power and a movable means arranged in relation to the electrical drive means in such a way that the movable means performs a mechanical movement when electrical power is supplied to the electrical drive means, and wherein an electric signal is induced in the electrical drive means when the portable telecommunication device is moved in a way that causes the movable means to move,

a sensing unit for sensing the induced electrical signal, and

a controller for controlling a desired operation of the portable telecommunication device by means of the signal induced in the electrical drive means, the controller including means for stopping the movable means in such a position that makes it possible for it to move when the portable telecommunication device is moved.

13. (Previously Presented) A portable telecommunication device as defined in claim 12, wherein the electromechanical actuator is a rotating electric motor provided with rotating eccentric means.

14. (Previously Presented) A portable telecommunication device as defined in claim 12, wherein the electromechanical actuator is a linear electric actuator provided with coil means and a moving magnetic core.

15. (Previously Presented) A portable telecommunication device as defined in claim 14, further comprising a keypad coupled to the controller.

16. (Previously Presented) A portable telecommunication device as defined in claim 15, wherein the portable telecommunication device is a cellular phone.

17. (Previously Presented) A portable telecommunication device as defined in claim 12, wherein the portable telecommunication device is moved in a way corresponding to shaking the portable telecommunication device.
